

LoveTap.Me

Admin Guide

Everything you can do from the web admin panel, with the flow for each.

Overview

The admin panel is a **web dashboard** (separate from the mobile app your merchants use). It has seven sections in the left menu: **Dashboard**, **Customers**, **Transactions**, **Payouts**, **NFC Chips**, **Fees**, and **Settings**.

- Sign in at **https://lovetap.me** with your admin email and password.
- Your merchants sign up in the mobile app; tippers pay on the web with no account.

Dashboard

- At-a-glance totals: **Total Tips**, **Active Customers**, and **Fees Collected** (paid by tippers).
- A **Recent Transactions** list so you can see activity as it happens.

NFC Chips

This is where you create the chips and control who each one pays.

Create & program a batch

- 1 Click **Generate Batch**, enter a quantity (up to 5,000), and confirm.
- 2 A **CSV** downloads with a **tap_url** column — e.g. `https://lovetap.me/t/LT-XXXX-XXXX`. That URL is what gets programmed onto each physical chip.
- 3 Program the tags from that list, then **lock them read-only** so the URL can't be changed.
- 4 Re-download any batch's CSV anytime from the **Code Batches** panel.

Manage individual chips

- **Tap URL** column — shows each chip's live URL; click to copy one.
- **Register Chip** — add a single chip by code.
- **Link / Unlink** — assign an unclaimed chip to a merchant, or release it back to the pool.
- **Disable / Delete**, filter by *unassigned* / *assigned* / *active* / *disabled*, and search by code or customer.
- Top stats show **Total / Active / Assigned** counts.

Customers

Add and manage the merchants who receive tips.

- **Add Customer** — name, email, phone, password. The **Chip Code** field is optional: enter a code from a batch to assign it now, or leave blank to auto-generate one.
- Open a customer to see their **tips**, **payouts**, and **chip**, plus their bank-connection status.
- **Change code** (on the customer page) — swap the customer to a different batch code; the old chip is released back to the pool automatically.
- **Activate / Deactivate** or **Delete** a customer from the row menu.

Merchants can also self-register in the mobile app — a chip code is auto-generated and linked to them on sign-up, and they appear here automatically.

Fees

- **Processing Fee** (percentage + flat) — what the **tipper** pays on top of the tip. Set it to at least cover Square's processing so your merchant keeps the full tip.

- **Platform Fee — your cut** — your own revenue, taken from each payment into **your** Square account. It comes out of the processing fee, so it is **not** added on top for the tipper. (65 bps = 0.65%.) Leave at 0 to collect nothing.
- The **Tipper Preview** on the right updates live to show what the tipper pays and what you keep. Click **Save Changes** to apply.

Transactions

- Every tip across all merchants: **Reference ID, Customer, Tip Amount, Total Charged, Status, Date.**
- Search by customer or ID, open **View details**, or **Copy reference ID** for support/reconciliation.

Payouts

- Tracks money owed and paid: **Worker, Amount, Destination, Status, Requested, Completed.**
- **Process** a pending payout, or **Retry** a failed one, from the row actions.

Tips settle **directly** into each merchant's own Square account, and Square pays them out to their bank on its normal schedule — so most money movement is automatic.

Settings

- Update your admin **Profile** (name, email) and manage **Email Notification** preferences.

Before going live

- Confirm **lovetap.me** DNS is pointed at the app before programming any chips (they lock read-only).
- Switch **Square from test to production** mode so real cards work.
- Change the default admin password.
- Program one test chip and run a real tip end-to-end.
