

LoveTap.Me

Run the platform from `adminpanel.lovetap.me`.

Sign in at **adminpanel.lovetap.me**. Sections: Dashboard, Customers, NFC Chips, Transactions, Payouts, Fees, Settings.

NFC Chips — create the products

- 1 **Generate Batch** → choose a quantity → download the **CSV** of codes + tap URLs.
- 2 Program each pendant with its URL (`app.lovetap.me/t/LT-XXXXXX`) and **lock it read-only**.
- 3 Codes are permanent — they are never changed or reused. Workers claim them by tapping.

Workers self-enroll on the web: they tap a pendant, sign up or log in, and the pendant is added to their account. A worker can own multiple LoveTaps under one account.

Customers (workers)

- View each worker: their LoveTaps, tips, payouts, Square status, and reseller-verification status.
- Activate / deactivate / suspend. Reassigning a product preserves the prior owner's history.

Fees

- Set the **platform (application) fee** — your cut, collected via Square's app fee into your Square account.
- The customer's total is **grossed up** so the worker nets the exact displayed tip after Square's processing fee and your fee. The customer sees a **LoveTap service fee**.

Transactions & Payouts

- **Transactions** — every tip, with refund/dispute status and audit history.
- **Payouts** — **view & reconcile** Square payout status (sent/paid/failed). LoveTap does not process payouts; Square pays workers directly from their own balance.

Settings & security

- Square OAuth tokens are stored server-side and auto-refreshed; workers can reconnect/disconnect.
- Square webhooks are signature-verified with duplicate-event protection.

Before going live

- Point DNS, switch Square from test to production, change the admin password.
- Program one test pendant and run a full tip end-to-end.
